

Operating system principle

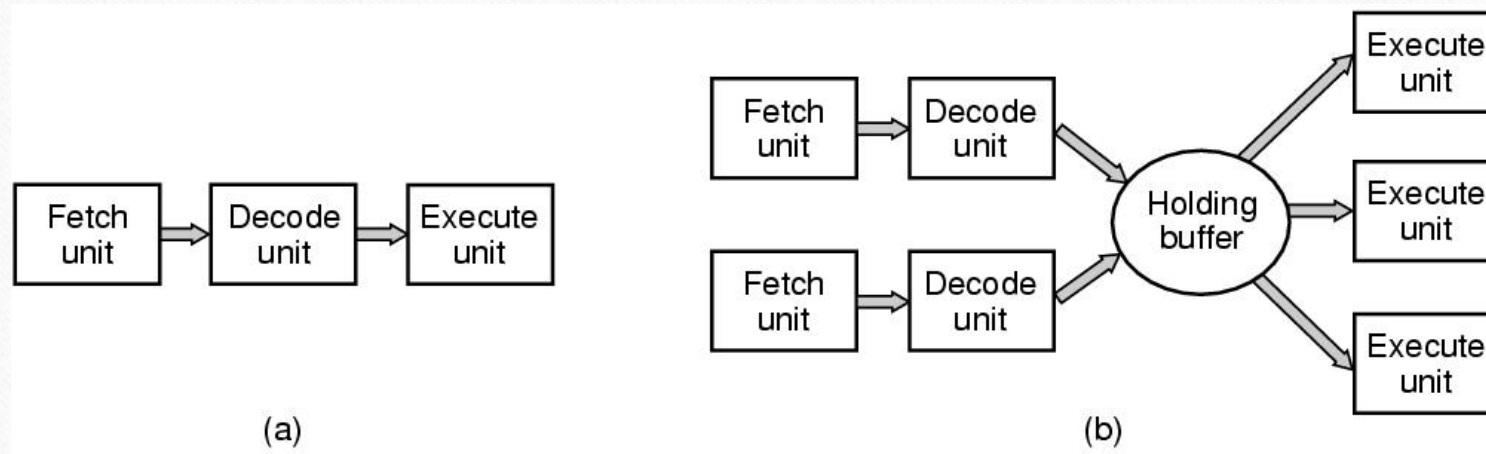

Overview

Computer Hardware Review

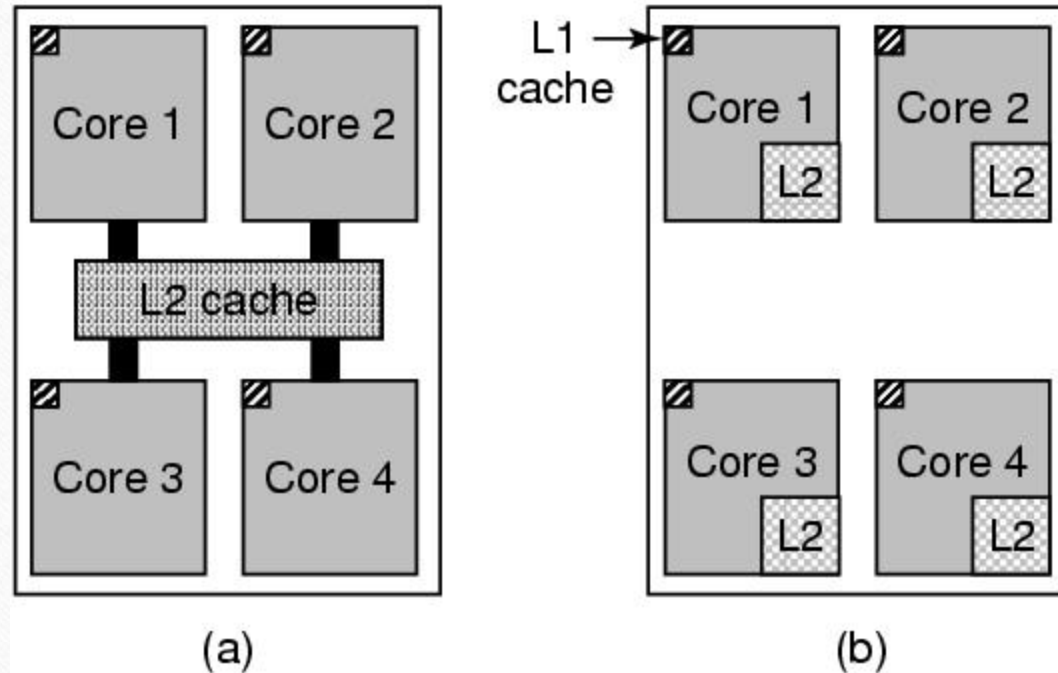

Some of the components of a simple personal computer.

CPU Pipelining

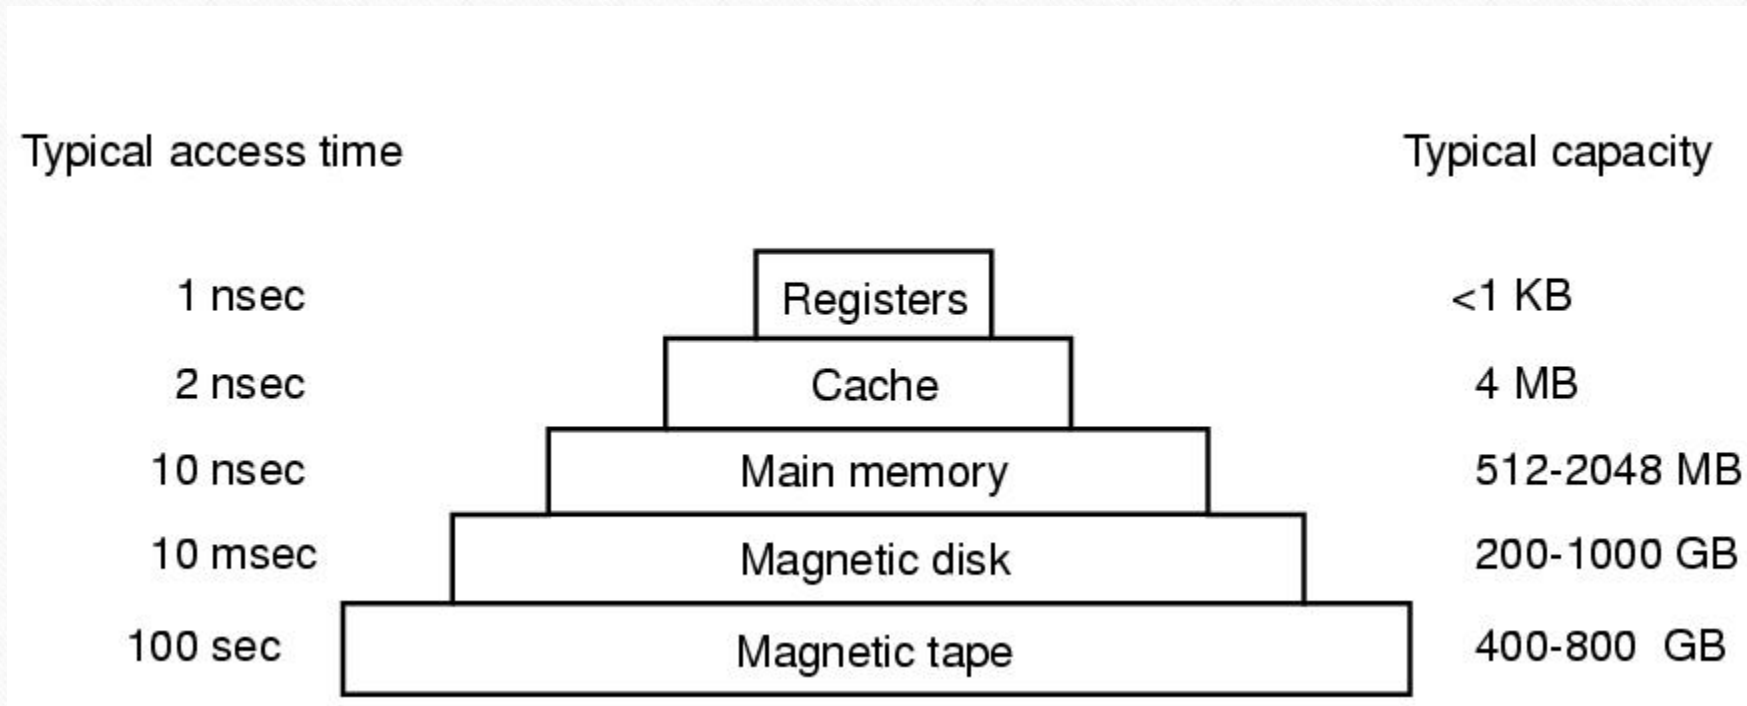

(a) A three-stage pipeline. (b) A superscalar CPU.

Multithreaded and Multicore Chips

- (a) A quad-core chip with a shared L2 cache.
- (b) A quad-core chip with separate L2 caches.

Memory (1)

A typical memory hierarchy.
The numbers are very rough approximations.

Memory (2)

Questions when dealing with cache:

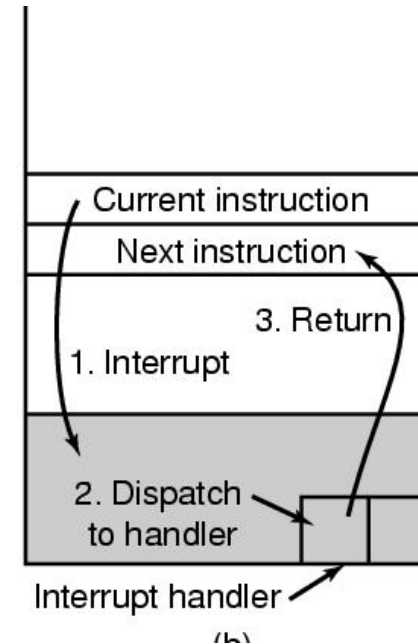

- When to put a new item into the cache.
- Which cache line to put the new item in.
- Which item to remove from the cache when a slot is needed.
- Where to put a newly evicted item in the larger memory.

Disks

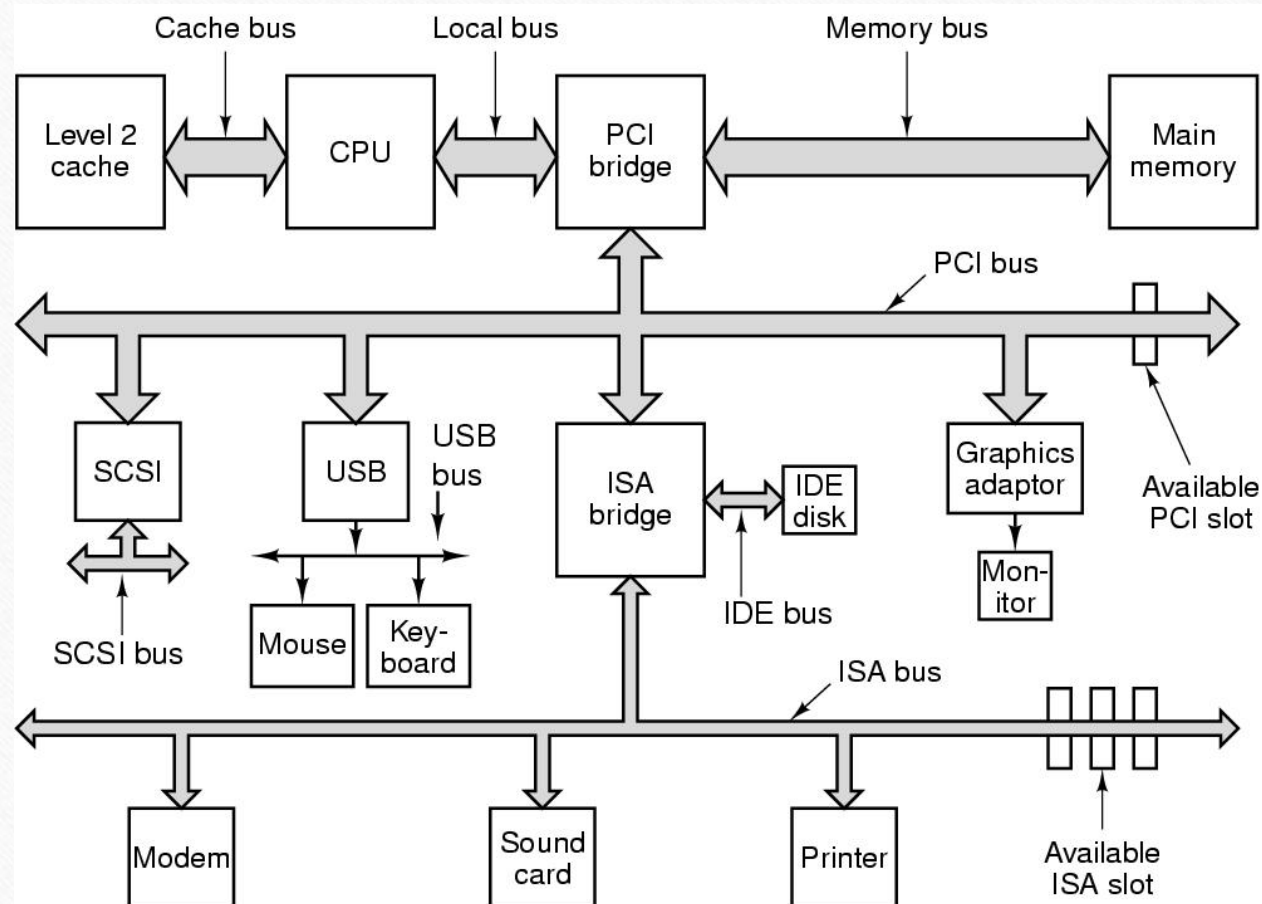

Structure of a disk drive.

I/O Devices

The steps in starting an I/O device and getting an interrupt.

Buses

The structure of a large Pentium system

The Operating System Zoo

- Mainframe operating systems
- Server operating systems
- Multiprocessor operating systems
- Personal computer operating systems
- Handheld operating systems
- Embedded operating systems
- Sensor node operating systems
- Real-time operating systems
- Smart card operating systems

Operating System Concepts

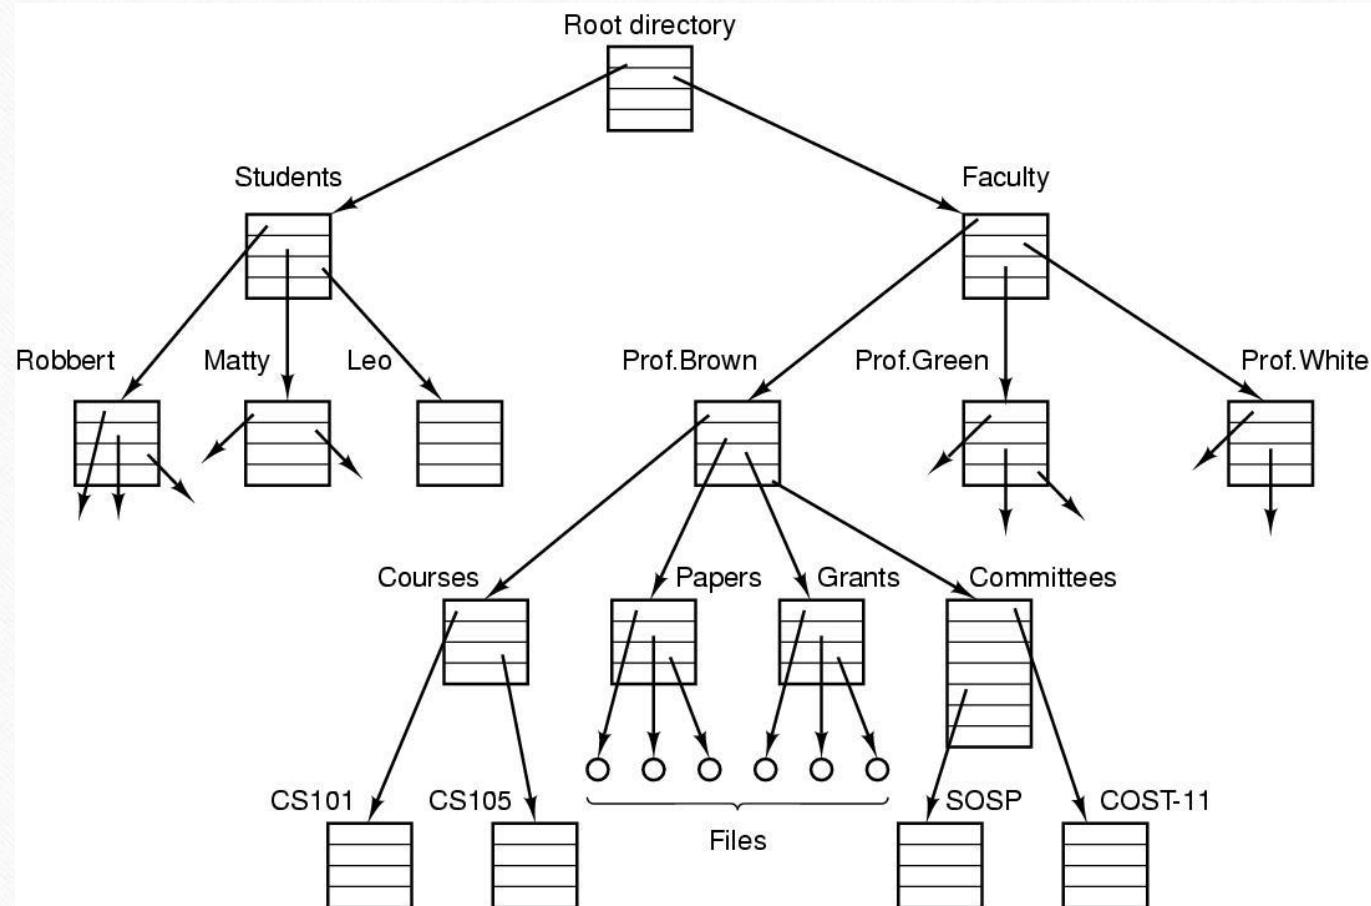

- Processes
- Address spaces
- Files
- Input/Output
- Protection
- The shell
- Ontogeny recapitulates phylogeny
 - Large memories
 - Protection hardware
 - Disks
 - Virtual memory

Processes

A process tree. Process A created two child processes, B and C.
Process B created three child processes, D, E, and F.

Files (1)

A file system for a university department.

Files (2)

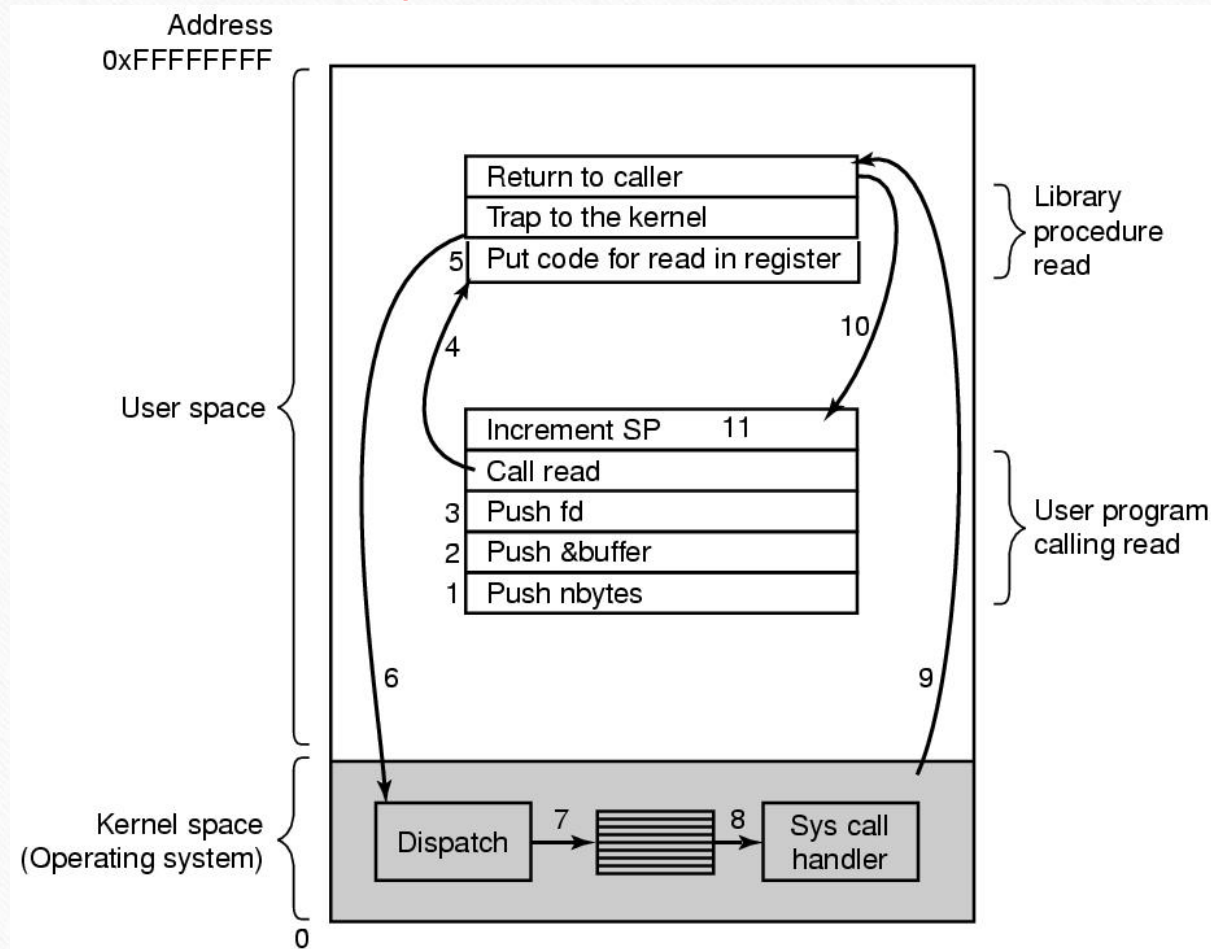

- (a) Before mounting, the files on the CD-ROM are not accessible.
(b) After mounting, they are part of the file hierarchy.

Files (3)

Two processes connected by a pipe.

System Calls

The 11 steps in making the system call `read(fd, buffer, nbytes)`.

System Calls for Process Management

Process management	
Call	Description
<code>pid = fork()</code>	Create a child process identical to the parent
<code>pid = waitpid(pid, &statloc, options)</code>	Wait for a child to terminate
<code>s = execve(name, argv, environp)</code>	Replace a process' core image
<code>exit(status)</code>	Terminate process execution and return status

Some of the major POSIX system calls.

System Calls for File Management (1)

File management

Call	Description
<code>fd = open(file, how, ...)</code>	Open a file for reading, writing, or both
<code>s = close(fd)</code>	Close an open file
<code>n = read(fd, buffer, nbytes)</code>	Read data from a file into a buffer
<code>n = write(fd, buffer, nbytes)</code>	Write data from a buffer into a file
<code>position = lseek(fd, offset, whence)</code>	Move the file pointer
<code>s = stat(name, &buf)</code>	Get a file's status information

Some of the major POSIX system calls.

System Calls for File Management (2)

Call	Description
s = mkdir(name, mode)	Create a new directory
s = rmdir(name)	Remove an empty directory
s = link(name1, name2)	Create a new entry, name2, pointing to name1
s = unlink(name)	Remove a directory entry
s = mount(special, name, flag)	Mount a file system
s = umount(special)	Unmount a file system

Some of the major POSIX system calls.

Miscellaneous System Calls

Call	Description
<code>s = chdir(dirname)</code>	Change the working directory
<code>s = chmod(name, mode)</code>	Change a file's protection bits
<code>s = kill(pid, signal)</code>	Send a signal to a process
<code>seconds = time(&seconds)</code>	Get the elapsed time since Jan. 1, 1970

Some of the major POSIX system calls.

A Simple Shell

```
#define TRUE 1

while (TRUE) {                                /* repeat forever */
    type_prompt( );                          /* display prompt on the screen */
    read_command(command, parameters);       /* read input from terminal */

    if (fork( ) != 0) {                      /* fork off child process */
        /* Parent code. */
        waitpid(-1, &status, 0);            /* wait for child to exit */
    } else {
        /* Child code. */
        execve(command, parameters, 0);     /* execute command */
    }
}
```

A stripped-down shell.

Memory Layout

Processes have three segments:
text, data, and stack.

Linking

- (a) Two directories before linking `/usr/jim/memo` to ast's directory.
(b) The same directories after linking.

Mounting

(a)

(b)

(a) File system before the mount. (b) File system after the mount.

Windows Win32 API

UNIX	Win32	Description
fork	CreateProcess	Create a new process
waitpid	WaitForSingleObject	Can wait for a process to exit
execve	(none)	CreateProcess = fork + execve
exit	ExitProcess	Terminate execution
open	CreateFile	Create a file or open an existing file
close	CloseHandle	Close a file
read	ReadFile	Read data from a file
write	WriteFile	Write data to a file
lseek	SetFilePointer	Move the file pointer
stat	GetFileAttributesEx	Get various file attributes
mkdir	CreateDirectory	Create a new directory
rmdir	RemoveDirectory	Remove an empty directory
link	(none)	Win32 does not support links
unlink	DeleteFile	Destroy an existing file
mount	(none)	Win32 does not support mount
umount	(none)	Win32 does not support mount
chdir	SetCurrentDirectory	Change the current working directory
chmod	(none)	Win32 does not support security (although NT does)
kill	(none)	Win32 does not support signals
time	GetLocalTime	Get the current time

The Win32 API calls that roughly correspond to the UNIX calls

Operating Systems Structure

Monolithic systems – basic structure:

- A main program that invokes the requested service procedure.
- A set of service procedures that carry out the system calls.
- A set of utility procedures that help the service procedures.

Monolithic Systems

```
#define FALSE 0
#define TRUE 1
#define N      2                /* number of processes */

int turn;                       /* whose turn is it? */
int interested[N];              /* all values initially 0 (FALSE) */

void enter_region(int process);  /* process is 0 or 1 */
{
    int other;                  /* number of the other process */

    other = 1 - process;        /* the opposite of process */
    interested[process] = TRUE; /* show that you are interested */
    turn = process;             /* set flag */
    while (turn == process && interested[other] == TRUE) /* null statement */ ;
}

void leave_region(int process)   /* process: who is leaving */
{
    interested[process] = FALSE; /* indicate departure from critical region */
}
```

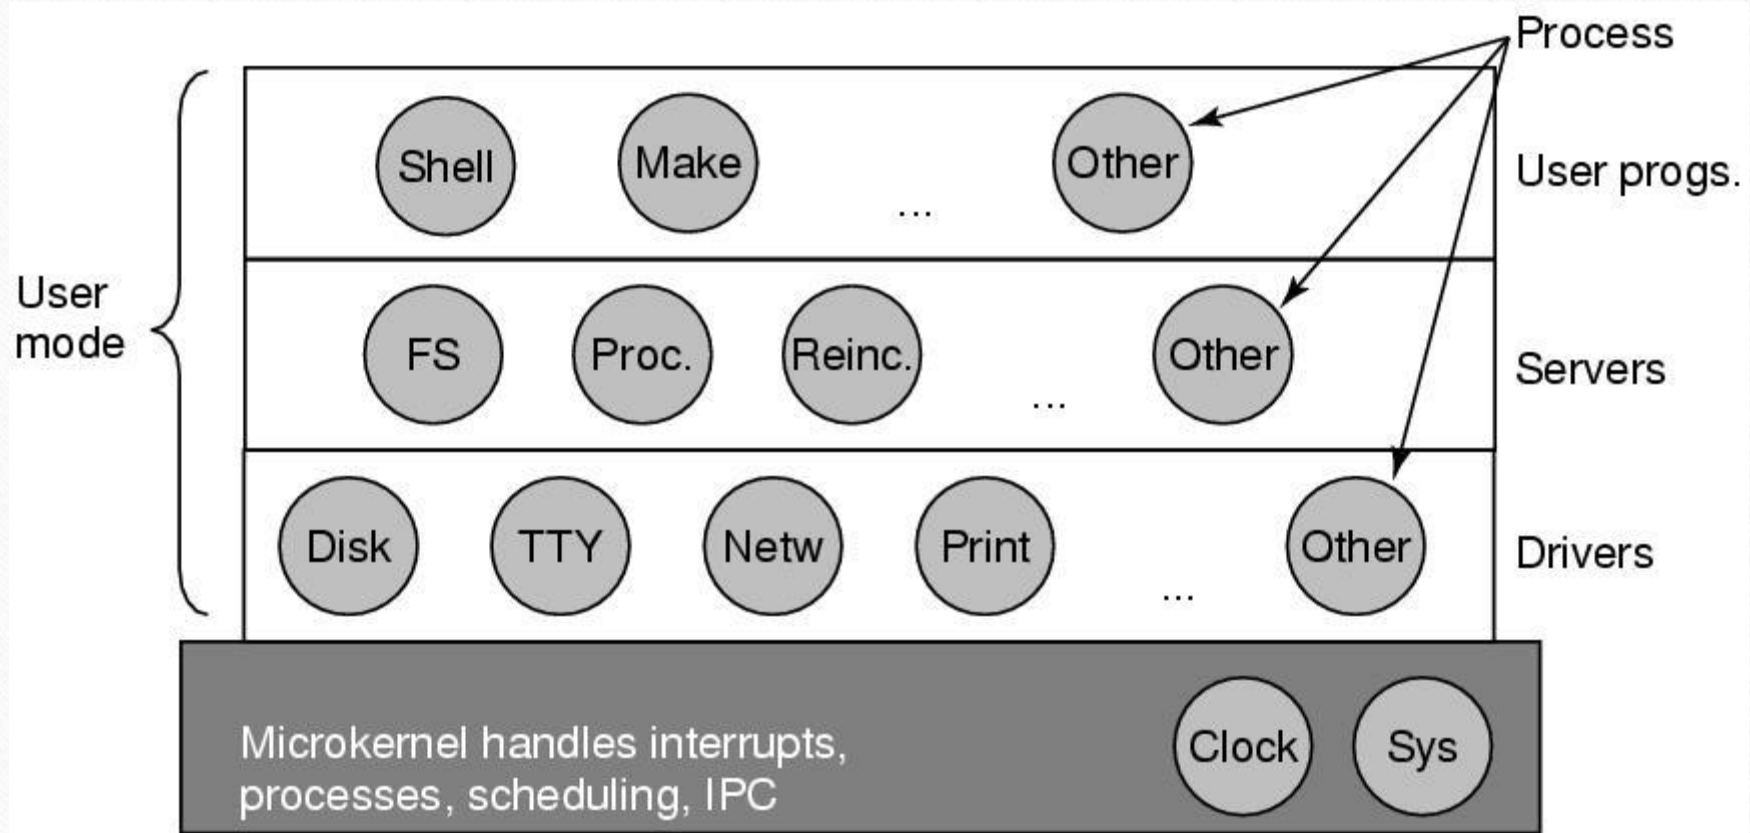

A simple structuring model for a monolithic system.

Layered Systems

Layer	Function
5	The operator
4	User programs
3	Input/output management
2	Operator-process communication
1	Memory and drum management
0	Processor allocation and multiprogramming

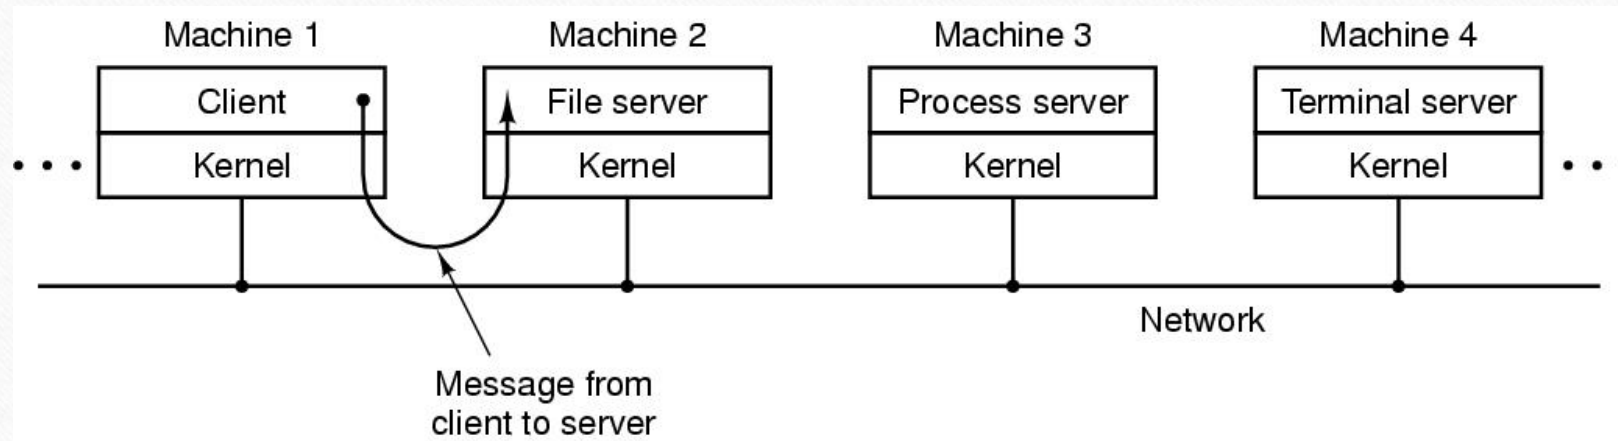

Structure of the THE operating system.

Microkernels

Structure of the MINIX 3 system.

Client-Server Model

The client-server model over a network.

Virtual Machines (1)

The structure of VM/370 with CMS.

Virtual Machines (2)

(a)

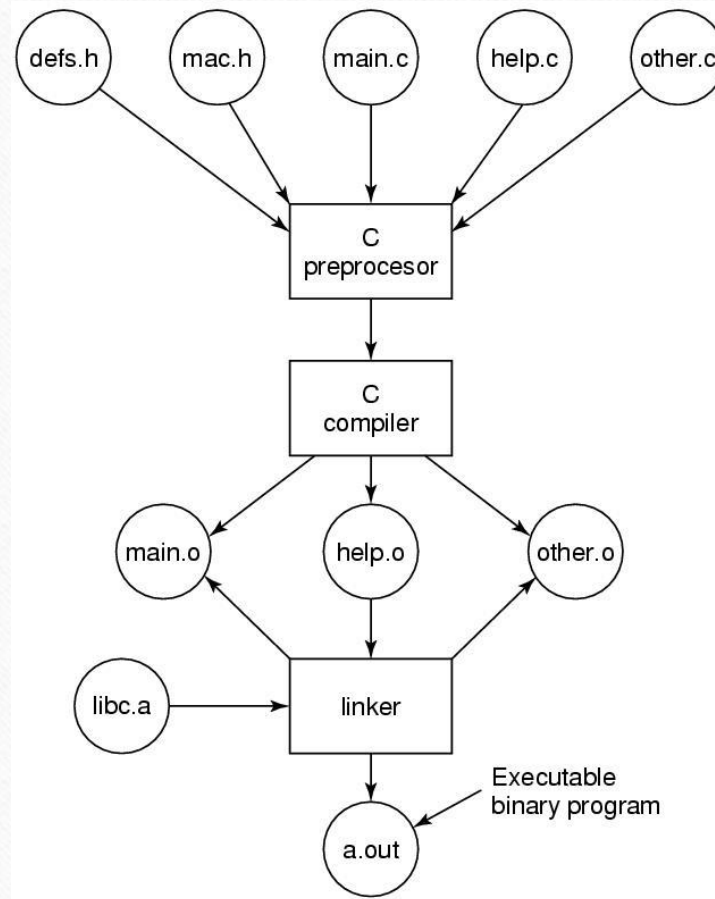

(b)

(a) A type 1 hypervisor. (b) A type 2 hypervisor.

The World According to C

- The C language
- Header files
- Large programming projects
- The model of run time

The Model of Run Time

The process of compiling C and header files to make an executable.
